

STRAVYX

Australia's On-Demand Drone Services Network

APP 8 live-ops gate - close-out brief for Liz and Joel

Gate open | Files-only may ship | Live radio / auto-upload blocked

Stravyx Pty Ltd ACN 696 964 271 | 16 Aug 2026 | CONFIDENTIAL | Not legal advice

Source: docs/app8-live-ops-gate-closeout.md. Audience: Liz (Consent & Privacy Policy v4, DPIA) and Joel (gate owner). Purpose: list every decision, notice, and sign-off needed to lift the DJI live-ops APP 8 blocker (ERD section 13.16). Not legal advice, not an engineering build ticket, and not the APP 3/5 operator-outreach review.

Status: Gate open. Manual photo cupboard (S0) and DJI Cloud API licence application may proceed. Production live radio / live map / auto-upload / livestream / dock remote-control may not. Until the sign-off block is completed, the product fails closed: operators finish jobs by tapping status and uploading files by hand.

1. One-page brief

Stravyx is a shop: customers book a drone job; a licensed operator (ReOC) wins it; files come back through us. Some operators will later plug a DJI remote into our cloud so a live map and automatic photos can work. That radio can involve personal information (photos of people's homes, a pin over a house) and computers outside Australia (including DJI checking a licence).

Australian Privacy Principle 8 (APP 8) is the rule about sending personal information overseas. A DPIA is the written list of every stop the data makes and who is responsible. Joel locked: do not start production live-ops until Consent & Privacy Policy v4 discloses that overseas story (Liz).

Allowed now	Blocked until this pack is signed
Book -> Accept -> operator manually uploads in Stravyx	Live map of the aircraft
Real signed upload, hold, Release, customer download (S0)	Automatic photos from the DJI remote
Apply for DJI developer / Cloud API licence	Livestream to the customer
Ordinary we collect site photos notices for the manual path	Dock fly from the office commands
	Production MQTT radio (remote to us)

Do not mix this review with APP 3/5 operator-database outreach. Different data, different notices.

Who	Owns
Liz	v4 redline; DPIA / hop list; customer and operator notices; APP 3/5 stays separate; DJI DPA countries (verify, do not guess)
Joel	What Live-ops A actually offers (live map? auto photos?); commercial fail-closed; written gate closed
Engineering	Hide Connect Pilot / live map / auto-upload until sign-off; never put secrets in the phone; S0 cupboard can ship without this gate

1a. What if we never use live radio or automatic sync?

Then you do not need to close this live-ops APP 8 gate to ship the product. You simply do not enter it. Live radio means the DJI remote is logged into a Stravyx room and sends live location to our servers. Automatic sync means the remote puts photos in our cupboard after landing, without the website upload button.

What customers still get	What they do not get
Book, pay Network Price, first-to-accept	A moving pin on Track Job

Operator taps Ready -> Airborne -> Complete	Photos appearing by themselves after landing
Operator uploads files by hand for that job	Livestream, dock remote-fly, FlightHub
Hold -> Release -> customer download	Any Pilot 2 join Stravix cloud in production

This live-ops gate (ERD 13.16) is about Pilot-to-Cloud / Dock-to-Cloud ingest. No ingest -> the blocker for those features stays parked, not failed. Engineering must not turn on MQTT, Connect Pilot, live map, or auto-upload. The marketplace file loop can still go live (S0).

APP 8 does not disappear entirely. Photos of someone's house are still personal information. If our cupboard is in Tokyo, sending those files overseas is APP 8 because of our hosting, not because of DJI. Liz still needs collection notices and a residency call (decision D3).

How Joel can record this (recommended): Live-ops A is files-only. No live radio, no auto-upload. Section 13.16 gate remains open; production must fail-closed for Connect Pilot. S0 manual path approved. You can apply for a DJI licence now so Layer 2 is possible later; that application is not turning the radio on.

2. Glossary

Term	Plain meaning
APP 8	Australian Privacy Principle 8 - cross-border disclosure of personal information.
DPIA	Written map: what we collect, where it goes, which country, who is responsible.
Personal information	Photos/video of a site that can identify a person or their home; a live map pin.
ReOC	Licensed Australian drone company. Stravix never holds this licence.
Pilot 2	DJI flying app on the handheld remote's screen.
Stravix room	The company hotel Pilot 2 checks into so status and photos go to us, not FlightHub 2.
MQTT	The industrial walkie-talkie the remote uses to our servers. Browsers never use it.
STS	Temporary luggage tag so the remote can put files in our cupboard without our permanent password.
Fail-closed	If the gate is open or later withdrawn, live connect disappears. The job can still finish by hand.
FlightHub 2	DJI's own hotel. Not on the Live-ops A path. A later maps/3D buy would be a new APP 8 pass.

3. What is in this gate vs out

Operator / product behaviour	This live-ops APP 8 gate?	Still think about privacy?
Taps status; uploads in the Stravix website	No - S0 may ship	Yes, lightly: where we store files; collection notices
Customer live map of the aircraft	Yes	Yes
Automatic photos from Pilot 2	Treat as yes until you exclude auto site imagery	Yes
Live video in the browser	Yes (named in 13.16)	Yes - out of Live-ops A until a later gate
Dock remote commands	Yes (named in 13.16)	Yes - out of Live-ops A
DJI licence / heartbeat while using our Sydney radio	Yes - hosting in Australia does not delete this hop	List it in the DPIA even if unverified country
Alex's own DJI app cloud backup	Not this gate	Policy should say we are not that cloud
HubSpot leads / operator outreach	Out of this pack (APP 3/5)	Separate Liz track

Recommended default until you write otherwise: auto site imagery is inside this gate. Do not turn on production auto-upload without a signed exclusion.

4. User stories (language you can sign)

Priya - customer

Given Priya books and pays the Network Price. When the operator flies her site. Then she has been told, in plain language at booking (and in Policy v4), that site photos are collected to deliver the job; if a live map is on, that her job location may be shown to her while it runs; she downloads files from Stravix only after the operator Releases them; she does not get a live pin unless that path is approved and disclosed. Fail-closed: if live map is not approved, she still gets files via manual upload.

Alex - operator (ReOC)

When the live-ops gate is open: he does not see Connect DJI Pilot as a live production action; he taps status and uploads by hand. When the gate is closed for the features you approved: he may check Pilot 2 into his company's Stravix room; Brooke's company must never see his jobs or drones; upload tags only apply to this flight on this job.

Stravix admin

Given disclosure is withdrawn or a subprocessor changes country. Then admin (or a config flag) can turn live connect off without taking down booking or manual upload.

5. Scenarios

P1 - Manual only, cupboard in Australia

Alex flies, goes home, uploads 40 photos in Stravix. Files stay in Sydney. This gate: No. Write: collection notice for site photos; retention; who the ReOC vs Stravix is.

P2 - Manual only, cupboard in Tokyo (today's demo)

Same as P1; file lands in Japan. Overseas because of our hosting, not DJI. This gate: still no for DJI radio. Write: APP 8 for Stravix storage region. Decide: live customer files must be Sydney?

P3 - Live map, photos still manual

Pilot 2 is in Alex's Stravix room. Priya watches a pin. This gate: Yes. Write: v4 + DPIA for live location; customer notice that a pin may appear; fail-closed if they reject live map.

P4 - Auto photos, no live map

After landing the remote puts photos in our cupboard. This gate: Yes, until you exclude auto imagery. Recommended: in.

P5 - Radio is in Sydney so APP 8 is done

Alex's remote talks to Sydney. The remote may still check its DJI licence with DJI overseas. This gate: Yes for any live radio. Write: name DJI as overseas recipient of licence/technical data. Liz confirms with DJI. Do not invent fields.

P6 - Alex also uses DJI's own cloud

Outside Stravix. This gate: No. Write: one sentence that Stravix is not responsible for the operator's own DJI account cloud.

R1 - Two companies, one shared hotel

If all operators shared one DJI Stravix room, Brooke might see Alex's drones. Write: Joel/Liz accept one room per ReOC (or accept shared-room risk in writing).

R2 - Wrong job's photos

The remote asks for an upload tag while paired to a different aircraft. Write: support hold then Release; engineering's this-flight wristband (capture session). Release is the customer-safety catch.

6. Hop inventory (DPIA homework)

Unverified = Liz to confirm with DJI DPA / vendor, not engineering guesswork.

ID	Hop	Country today
H1	Browser -> Stravyx API (account, job, suburb/address by role)	Demo often Tokyo API/DB
H2	Manual file upload -> object storage	Demo often not Sydney; target Sydney
H3	Optional malware/type scan	TBD - if overseas, APP 8
H4	Pilot 2 -> our MQTT/HTTPS (live status; bind; STS request)	Intended Sydney
H5	STS put -> S3/MinIO (auto photos)	Must match residency ruling
H6	DJI licence / Cloud API control plane	Unverified, likely overseas
H7	Customer browser <- Stravyx signed download	Same as H2
H8	Livestream CDN / WebRTC	TBD - new gate
H9	FlightHub 2 (later L2, not Live-ops A)	DJI SaaS overseas likely; new DPIA
H10	HubSpot leads (not mission photos)	Out of this pack (APP 3/5)

Visibility firewall (product, not APP 8): operators must not see customer total / Layer 2 economics; customers must not see the L1/L2 price split. Live pins must not leak full address to the wrong role.

7. Decision log (this is what removes the blocker)

Recommended defaults in the middle column. Tick after Liz/Joel fill.

#	Decision	Recommended default
D0	Ship files-only (no live radio, no auto-upload) for this release?	Yes, if you want to launch without closing 13.16. Gate stays open; Connect Pilot stays off. Does not skip D3-D6 for manual photos.
D1	Is automatic site imagery inside Consent v4 / this gate?	Yes - in-gate until explicitly excluded.
D2	Is a live map part of first live-ops, or files-only?	Files-only unless you choose to close this pack for live map.
D3	Storage residency for customer files	Sydney for any production customer imagery. Demo Tokyo must not be production SoT.
D4	Lawful basis - customer	Notified collection for delivering the job + consent if you offer optional live map. Counsel, not this doc.
D5	Lawful basis - operator	Spell the split: operator as independent collector in the field vs Stravyx as platform.
D6	Retention after delivered / dispute hold	e.g. job files N months; legal hold longer.
D7	Subprocessors named in v4	Stravyx hosting region; DJI (licence/technical); scanner TBD; no FH2 until L2.
D8	Fail-closed commercially OK?	Yes - live connect off, manual still completes the job.
D9	Docks / livestream / DRC in this sign-off?	No - later gates, later v4 delta.
D10	Gate closed for which features?	List explicitly. Engineering will not infer.

8. Consent v4 - draft clauses (for counsel; not legal advice)

Live location. If you use live tracking, the operator's controller may send the aircraft's approximate position to Stravyx so you can see job progress. That signal is processed on Stravyx systems [in Australia / see DPIA]. The controller may also exchange licence or technical data with DJI, which may be outside Australia.

Photos and video. Site imagery is collected to deliver your job. If automatic upload is enabled, the controller may send files to Stravyx storage after the flight. Files are held until the operator confirms they belong to this job, then you may download them from Stravyx. We are not DJI FlightHub; we do not use FlightHub for this service.

Manual path. You can complete a job by the operator uploading files in Stravyx without connecting a live controller. That path does not use the live radio.

Withdraw / fail-closed. If live connect is unavailable or you do not want live tracking, the operator can still finish the job by manual upload. Contact privacy@ to ask questions or complain to the OAIC.

Operators. You must only upload or auto-send imagery for jobs you are engaged to fly. You must not use Stravix to access another operator's jobs. Your own DJI account cloud is outside this policy.

9. Action checklist

Liz

- Redline Consent & Privacy Policy v4 for live radio + (if D1 yes) auto imagery + DJI overseas licence hop.
- DPIA covering hops H1-H7 (H8-H9 later); mark H6 verified or assumed.
- Customer notice at booking; operator notice at onboarding / Connect Pilot.
- Confirm APP 3/5 outreach is a different document.
- Request DJI DPA / subprocessors / regions. Do not block licence application.

Joel

- Fill D1-D10 (especially D1 auto imagery, D2 live map, D3 residency, D10 feature list).
- Accept fail-closed (D8) as production behaviour until/unless gate stays closed.
- Record gate closed (or closed for features X, still open for Y) in the sign-off block and DECISIONS.md.

Engineering (after sign-off - not a substitute)

- Fail-closed UX: no production Connect Pilot / live map / auto-upload while gate open.
- S0 manual cupboard may ship without waiting.
- No production MQTT until D10 list is closed.

Parallel (does not close the gate)

- DJI developer account + Cloud API licence application (Platform / Joel).
- One ReOC partner + supported hardware list (Product).

10. Sign-off

Not legal advice. Completing this block is the product/privacy signal engineering needs. Fields: Date; Liz (v4 + DPIA + notices); Joel (D1-D10 + gate); features explicitly in this close-out; features explicitly out (livestream, dock remote command, FlightHub 2, MSDK); fail-closed confirmed; auto site imagery in-gate?; storage residency for production files; link to v4 + DPIA.

Until this table is filled, the live-ops APP 8 gate remains open. Manual per-mission upload in Stravix remains the legal production path for files.
